

Jérémy Martin - Nicholas Vos - Nerea Asensio

MAInD - SUPSI 25/26

Digitally designed objects for fast prototyping

INSPIRATION

CONCEPT

This project is a **synesthetic listening object.**
It does not play music. **It plays places.**

HUMAN LOCI is an archive of human presence over time.

A compact listening box designed to frame sound as a physical, focused experience.

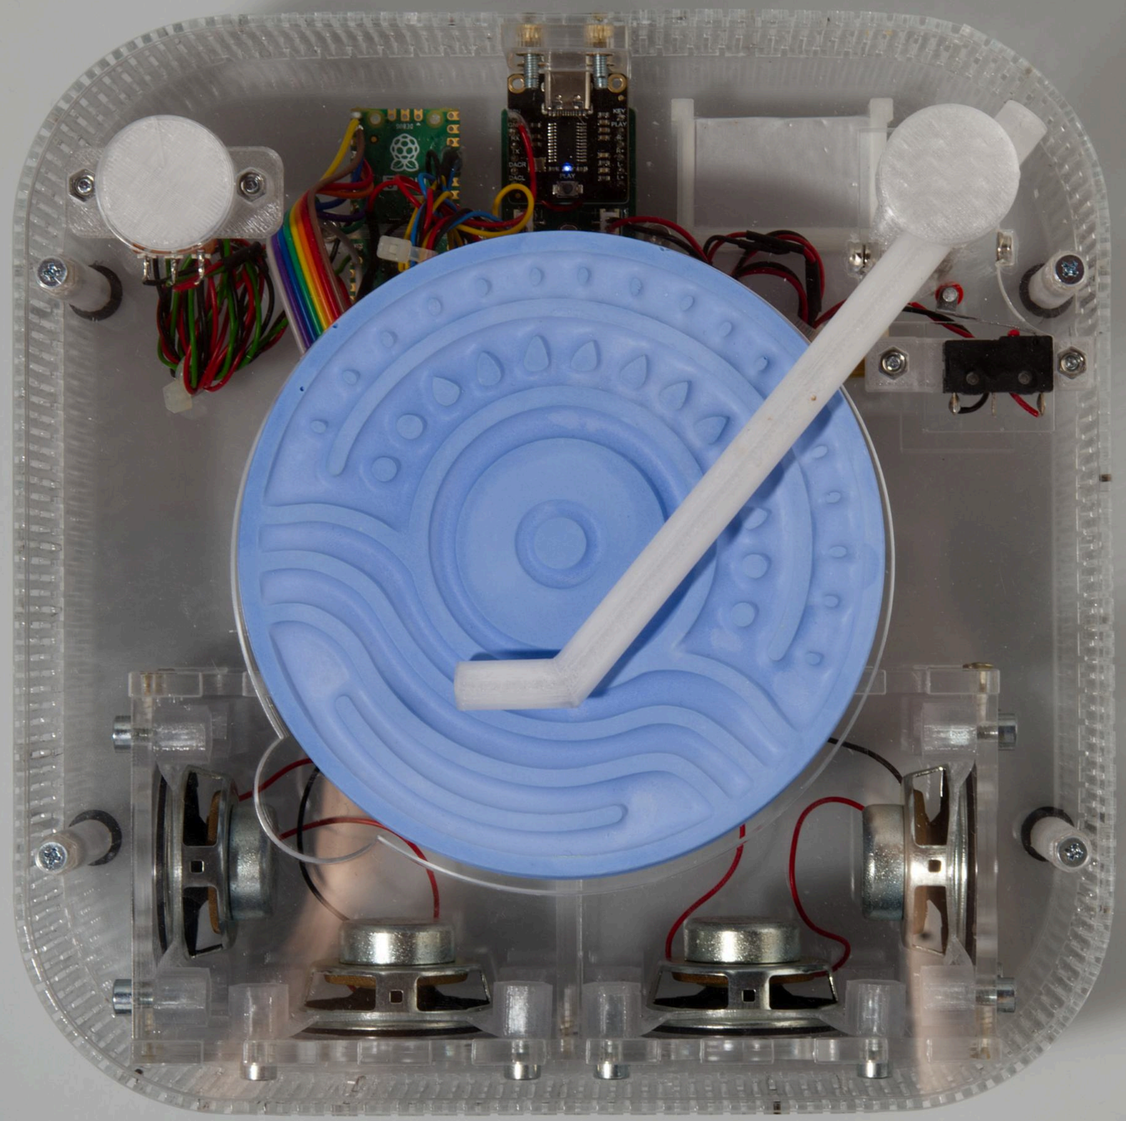

Volume control

Secondary interaction.
Direct, continuous control.
Minimal circular wheel, no additional interface.

Speaker box

Internal sealed enclosure.
Two independent chambers for stereo separation.
Designed for rigidity, airtightness, and clarity.

Tonearm

Primary interaction element.
Replaces a traditional on/off switch
Triggers playback through a magnetic cam mechanism

The interaction is simple: place the disk, engage the tonearm, listen.

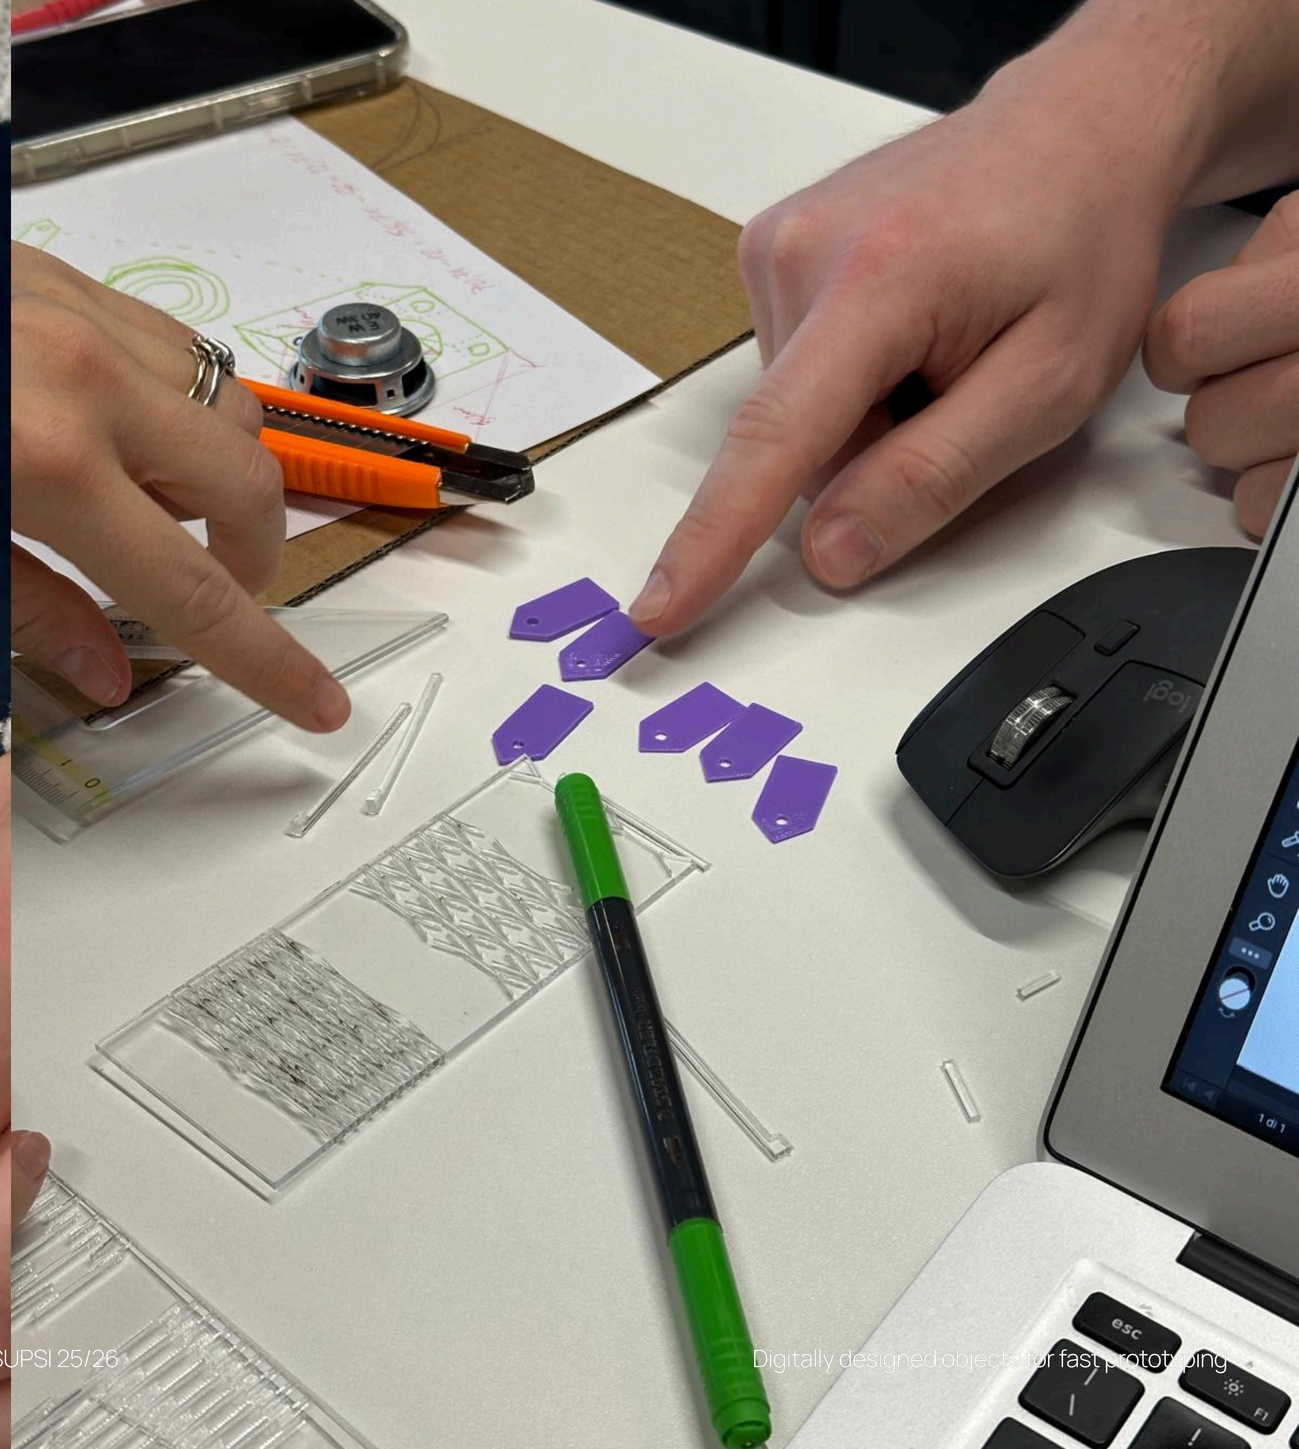

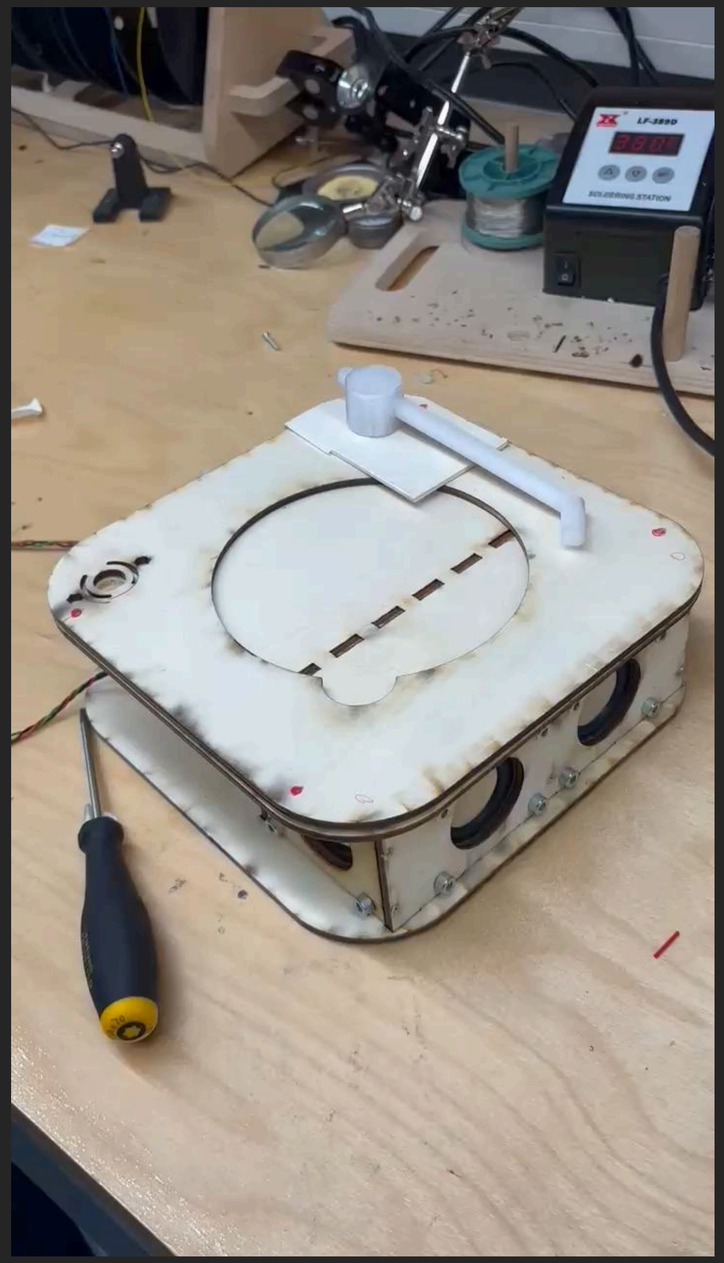

Making & System

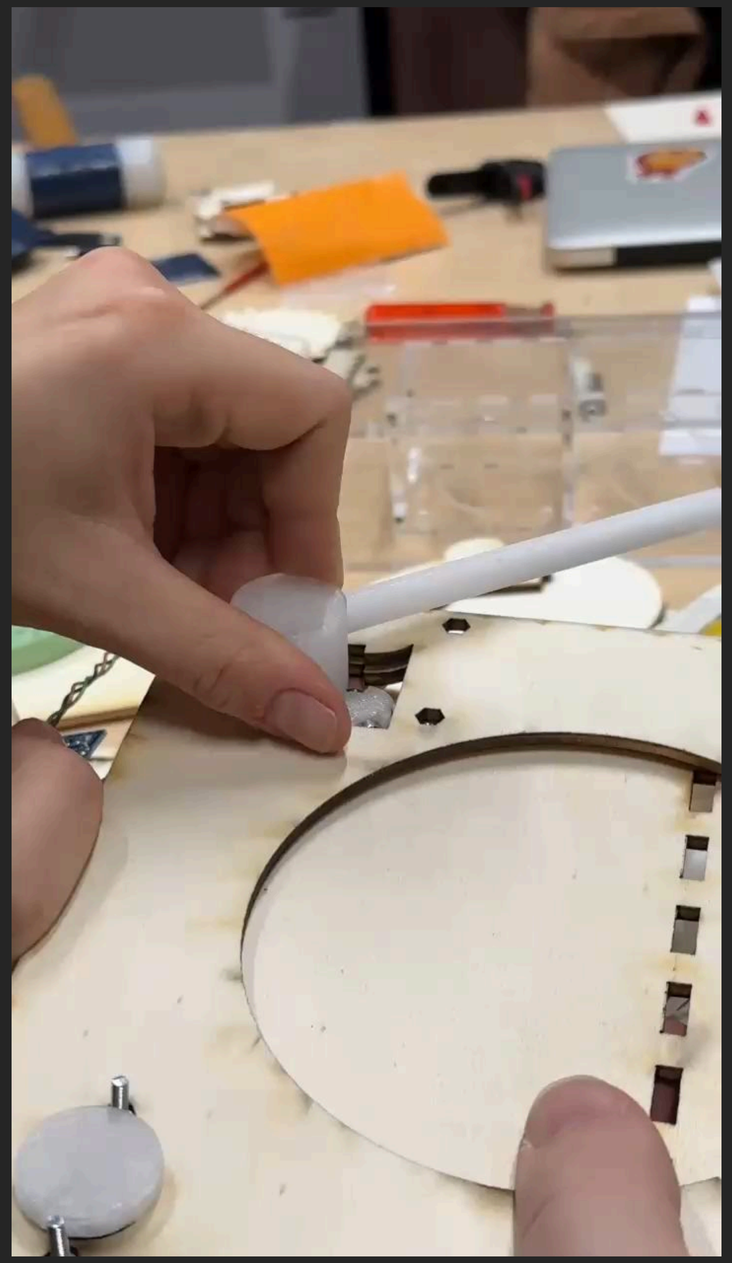

This object is built as a transparent system, where structure, sound and interaction remain visible and readable.

HUMAN LOCI proposes a different way of listening:
not to music, but to space.
